# IXP Manager (by INEX)

- FOSS tool for running IXPs
- V1 dates from late 90's (no framework, some PEAR libraries)
- V2 from 2008 (ZF1, Doctrine1, Smarty); V3 2012 with Doctrine2
- V4 from 2015 (ZF1 → Laravel, Doctrine2, Foil (like Plates))
- Sponsors include ISOC, Netflix, other IXs → full time developer
- Details at <https://www.ixpmanager.org/>

In use at over 60 IXPs around the world.  
And here in London at LONAP (also IXLeeds, IX Liverpool).

# Making the Case to Change Framework

## And the Approach

# Arguments for Change

1. Prevent developer apathy
2. You'll have to eventually. Putting it off costs more!
3. Build with modern techniques and services
4. Reference other applications that have migrated
5. More as we move through the presentation...

LibreNMS  
@LibreNMS

Following

We are going to be making a switch over to [@laravelphp](#) for our framework and we'd love some testers. This is the first stage of us making the switch and is the foundation of things to come:

[Add Laravel to LibreNMS by murrant · Pull Request #8318 · I...](#)  
Intercepts all routes and falls back to existing pages/api.  
Discovery/Poller should continue to work, if not updating via daily.sh, you will need to run: composer install --no-dev .env wil...  
[github.com](https://github.com)

4:20 pm - 13 Apr 2018

**LibreNMS is a fully featured network management system in use by thousands of networks around the world.**

km  
13 An Teach Doite  
**LEGACY APP**

An Lionan km  
**LARAVEL**

# Prerequisites

1. Your legacy application is using composer
  - Or can migrate to it and use auto-loaders (classmap, psr-0/4)
2. Your application has a single point of entry (index.php)
  - Can work around with (secure) `$_REQUEST` examination
3. Your application exists in a subdirectory such as public/

Best advice would be to complete these before proceeding.

# Let's Migrate - Recap

1. Application: IXP Manager
2. Audience: Open Source / Self Install
3. No flag day - side by side
4. Framework Order: Laravel first

# Side by Side - Install Laravel (1)

Add Laravel files to your application

- git clone the latest Laravel to a separate directory
- move files over to your application
- resolve conflicts - level of difficulty: framework dependant
  - ZF / CodeIgniter / Symfony all look okay-ish

# Side by Side - Install Laravel (2)

```
git clone https://github.com/laravel/laravel.git  
cd laravel
```

```
mv app/ artisan bootstrap/ config/ database/ package.json \  
  phpunit.xml resources/ routes/ server.php storage/ tests/ \  
  webpack.mix.js ..../legacyapp
```

```
mv public/js/app.js ..../legacyapp/public/js  
mv public/css/app.css ..../legacyapp/public/css
```

(ignored: public/index.php (for now), readme.md, CHANGELOG.md)

# Side by Side - Install Laravel (3)

Update composer.json (and run: composer update)

```
"require": {  
    ... ,  
    "fideloper/proxy": "^4.0",  
    "laravel/tinker": "^1.0",  
    "laravel/framework": "5.6.*"  
},
```

# Side by Side - Install Laravel (4)

Swap your legacy project's index.php for Laravel's

- Be mindful of any non-framework code you may have added
- (e.g. request timers)
- Note the framework start-up and handoff lines

# Side by Side - Install Laravel (5)

Switch to your framework from Laravel as either:

- a 404 handler
- a default route

# Side by Side - 404 Handler

app/Exceptions/Handler.php

```
use Symfony\Component\HttpKernel\Exception\NotFoundHttpException;  
// Render an exception into a HTTP response  
public function render( $request, Exception $e ) {  
    // Legacy Framework Fallback  
    if( $e instanceof NotFoundHttpException ) {  
        // hand off to legacy framework (old contents of index.php)  
        // ...  
        die();  
    }  
    // ...
```

# Side by Side - Default Route (1)

routes/web.php

*// Legacy Framework Routes*

```
Route::any( "/{path?}", "LegacyController@index" )  
    ->where( "path", ".*" );
```

# Side by Side - Default Route (2)

app/Http/Controllers/LegacyController.php

```
namespace App\Http\Controllers;

class LegacyController extends Controller {

    public function index($path = "") {
        ob_start();
        include base_path("html/legacy_index.php");
        return response( ob_get_clean() );
    }
}
```

# Legacy Framework as a Provider (1)

app/Providers/ZendFrameworkServiceProvider.php

```
class ZendFrameworkServiceProvider extends ServiceProvider {
    protected $defer = true;

    public function register() {
        $this->app->singleton("ZendFramework", function ($app) {

            require_once "Zend/Application.php";
            $zf = new Zend_Application(
                $app->environment(), $this->createOptions()
            );
            return $zf->bootstrap();
        });
    }
}
```

# Legacy Framework as a Provider (2)

Revisiting: app/Exceptions/Handler.php

```
// Render an exception into a HTTP response
public function render( $request, Exception $e ) {
    // Legacy Framework Fallback
    if( $e instanceof NotFoundHttpException ) {
        // hand off to Legacy framework (old contents of index.php)
        App::make("ZendFramework")->run();
        die();
    }
}
```

# The Migration

Controller by Controller.

(and views as necessary).

(and models as necessary).

# Other Side by Side Considerations

- parallel configurations - one for each framework
- session management
- user authentication
- views - duplication of menus, route changes
- models - chances are you're not using Eloquent
- tracking progress

# Parallel Configurations (1)

- internal one-off business application
- you can probably live with it?
- many installations / FOSS
- you need to sort this out early
- use your service provider to inject Laravel configuration into your legacy app

# Parallel Configurations (2)

- Zend Framework: application/configs/application.ini
- turns out Zend\_Application() can take an array for config

# Legacy Framework as a Provider (1)

app/Providers/ZendFrameworkServiceProvider.php

```
class ZendFrameworkServiceProvider extends ServiceProvider {
    protected $defer = true;

    public function register() {
        $this->app->singleton( "ZendFramework", function ($app) {

            require_once "Zend/Application.php";
            $zf = new Zend_Application(
                $app->environment(), $this->createOptions()
            );
            return $zf->bootstrap();

        });
    }
}
```

# Parallel Configurations (3)

- Zend Framework: application/configs/application.ini
- turns out Zend\_Application() can take an array for config
- our ZendFrameworkServiceProvider builds the array from Laravel configuration

# Parallel Configurations (4)

## Zend Framework example - application/configs/application.ini

```
; ; Put your email relay host here  
  
resources.mailer.smtphost = "127.0.0.1"  
  
resources.mailer.username = "joebloggs"  
  
resources.mailer.password = "soopersecret"  
  
resources.mailer.port = 25
```

# Parallel Configurations (5)

## Laravel example - config/mail.php

```
return [  
    'host'      => env( 'MAIL_HOST', 'localhost' ),  
    'port'      => env( 'MAIL_PORT', 25 ),  
    'username'  => env( 'MAIL_USERNAME' ),  
    'password'  => env( 'MAIL_PASSWORD' ),  
    // ...  
]
```

# Parallel Configurations (6)

## ZendFrameworkServiceProvider example

```
private function createOptions(): array {  
    // ...  
  
    $options["resources"]["mailer"]["smtphost"] = config("mail.host");  
    $options["resources"]["mailer"]["username"] = config("mail.username");  
    $options["resources"]["mailer"]["password"] = config("mail.password");  
    $options["resources"]["mailer"]["port"]      = config("mail.port");  
  
    // ...  
  
    return $options;  
}
```

# Parallel Configurations (7)

- Zend Framework: application/configs/application.ini
- turns out Zend\_Application() can take an array for config
- our ZendFrameworkServiceProvider builds the array from Laravel configuration
- now just one source of configuration

# Aside: When dotenv Isn't Enough

```
return [
    // ...
    'trunks' => call_user_func( function() {
        if( file_exists( config_path() . '/grapher_trunks.php' ) ) {
            return include( config_path() . '/grapher_trunks.php' );
        }
        return null;
    }),
    // ...
];
// in Git as config/grapher_trunks.php.dist
```

# Other Side by Side Considerations

- parallel configurations - one for each framework
- session management
- user authentication
- views - duplication of menus, route changes
- models - chances are you're not using Eloquent
- tracking progress

# Session Management (1)

App\Http\Kernel

- > middleware
- > Illuminate\Session\Middleware\StartSession

*// If a session driver has been configured, we will need to start the session here  
// so that the data is ready for an application. Note that the Laravel sessions  
// do not make use of PHP "native" sessions in any way since they are crappy.*

# Session Management (2)

- Laravel uses own cookie based session management
  - Therefore no conflicts with other Frameworks
- This is really convenient for side by side migrations
- Match session lifetimes between frameworks
  - Do this via config('session.lifetime') and config('session.expire\_on\_close')

# Other Side by Side Considerations

- parallel configurations - one for each framework
- session management
- user authentication
- views - duplication of menus, route changes
- models - chances are you're not using Eloquent
- tracking progress

# User Authentication (1)

- Frameworks handle this using sessions
- Laravel has its own session management system
- Objective: when logging into one framework, also log the user into the other framework
- And do the same for logouts

# User Authentication (2)

- When to migrate authentication?
- We're leaving it until the end

# User Authentication (3)

routes/web.php

```
$auth = Zend_Auth::getInstance();

if( php_sapi_name() !== "cli" ) {

    if( $auth->hasIdentity() && Auth::guest() ) {
        // Log the user in for Laravel
        Auth::login( App\User::findOrFail( $auth->getId() ) );
    } else if( !$auth->hasIdentity() ) {
        Auth::logout();
    }
}
```

# User Authentication (4)

## Migration Opportunities

- Laravel Socialite (OAuth)
  - For IXP Manager we plan PeeringDB OAuth
- 2-factor authentication
- "Login As" Functionality (via creative/sudo-su)
- Upgrade to Bcrypt / Argon2

# Other Side by Side Considerations

- parallel configurations - one for each framework
- session management
- user authentication
- views - duplication of menus, route changes
- models - chances are you're not using Eloquent
- tracking progress

# Migrating Views (1)

- I've used suffered through Smarty for a decade
- I don't tend to do frontend/backend separation
  - Blade is really nice - and getting better
  - I'm not saying do not use Blade!

# Migrating Views (2)

- PHP Templating Options: Plates<sup>1</sup> and Foil<sup>2</sup>
- Features as expected: Laravel compatibility, template layouts and inheritance, extensible, ...
- Skinning

1. <http://platesphp.com/>
2. <https://github.com/FoilPHP/Foil>

# Migrating Views (3)

- Side by side considerations:

- You'll have two layouts, two menu templates, etc. Need to update both of these!
- Do not forget to update routes / links
  - You could keep them the same
  - But you'll probably modernise them

# Migrating Views (4)

## Opportunities:

- Front end spruce up - for us: Bootstrap 2 → Bootstrap 3
- Improve layout / UX based on years(?) of experience
- Introduce i18n / l10n ?

# Other Side by Side Considerations

- parallel configurations - one for each framework
- session management
- user authentication
- views - duplication of menus, route changes
- models - chances are you're not using Eloquent
- tracking progress

# Migrating Models

- For IXP Manager it was easy: Doctrine2
  - <https://www.laraveldoctrine.org/>
- If migrating to Eloquent:
  - Be careful not to introduce schema / consistency issues between frameworks

# Other Side by Side Considerations

- parallel configurations - one for each framework
- session management
- user authentication
- views - duplication of menus, route changes
- models - chances are you're not using Eloquent
- tracking progress

# Tracking Progress

```
